Abstract

One of the challenges of providing standard library services is to create and properly deliver value for readers. In this information era the role of producers and consumers begins to blur and merge. Users and consumers are now changing their role as prosumers. Value is always co-created between the service provider and the service recipient. In line with this thinking, Value Co-creation could be identified as an active and creative social process, which could be identified and developed as an accelerating factor of Sri Lankan library service through the collaboration between the library and the users.

This study aims to determine some evidence of value co-creation activities in the Sri Lankan Library and Information sector. Using an exploratory research method and a descriptive research method, this study explains the identified evidence of value co-creation activities relevant to the Sri Lankan library sector. Collections of evidence were obtained from published and unpublished materials and websites of selected Sri Lankan libraries using the purposive sampling method in which the evidence was visible and accessible.

This study identified the following as evidence for value co-creation activities. Donation is treated as an accepted acquisition mode of any kind of library in Sri Lanka, where the readers and students donate books. The National Library and Documentation Centre receives rare and valuable books collections as donations from the readers of Sri Lanka. National publications are deposited to preserve intellectual rights of the authors. There are exhibitions and courses organized with the contribution of readers and scholars to improve the information literacy level. Schqol libraries encourage students in publishing hand written magazines which could function as a depositary for the benefit of future students. Library organizations such as SLLA, NILIS hold research sessions/conferences, for which academic library users and post graduate students contribute research papers. University libraries have a major role in dissemination of knowledge, and work with faculty users in managing the digital research repository of faculty research.
output at institutional level. E-mail groups such as library friends were developed by LIS professionals and they were much lauded by users for their remarkable support in information sharing. University libraries measure their reader’s usage on a particular book/periodical by date slips attached with the book. This data is used by other readers as invisible rating of that particular book. Bibliographic and documentation works are carried out by individual readers and students in their own interest. Some library users are active in social media, maintaining blogs on Sri Lanka. Through such evidence it is proved that economic values as well as social values are co-created by the collaboration between the libraries and the users in the Sri Lankan library sector. Further this study contributes to an understanding of value co-creation by reinforcing the contexts and conditions where collaborative forms of co-creation might be broadened in the Sri Lankan Library and information sector.
